# What is the National Water Model (NWM)?

## The NWM:

- is an operational hydrologic modelling framework built on WRF-hydro,
- started in 2016 (v1.0), evolved to v2.0 as of now
  - Upgrades in model physics and forcings, domain expansion
- simulates and forecasts how water moves throughout US rivers and streams,
- produces hydrologic guidance at a very fine spatial and temporal scale, complementing the NWS RFC hydrologic guidance.
  - Hourly, 250m-1km, 2.7 million river reaches in the CONUS
- produced real-time analysis (06/2019-present) and a 26-year (1993-2018) retrospective simulation for v2.0, which allows for **drought monitoring**
  - Streamflow, surface runoff, soil moisture, evaporation, snow, and other parameters.

# An NWM Project

- Project

- Application of the National Water Model for Drought Monitoring (09/2017-08/2020)

- Team

- NOAA/OWP: **Mark Glaudemans**, Dale Unruh, Fernando Salas, Fred Ogden
- NOAA/PSL: **Robert Webb**, Mimi Hughes, Darren Jackson, Mike Hobbins, Rob Cifelli, Bob Zamora
- NOAA/CPC: **David DeWitt**, Kingtse Mo, Hailan Wang, Li Xu, Muthuvel Chelliah
- NOAA/EMC: Jesse Meng
- Monthly telecons organized by **Mimi Hughes (PSL)**

# An NWM Project

- Application of the National Water Model for Drought Monitoring (09/2017-08/2020)

- Team

- NOAA/OWP: **Mark Glaudemans**, Dale Unruh, Fernando Salas, Fred Ogden
- NOAA/PSL: **Robert Webb**, Mimi Hughes, Darren Jackson, Mike Hobbins, Rob Cifelli, Bob Zamora
- NOAA/CPC: **David DeWitt**, Kingtse Mo, Hailan Wang, Li Xu, Muthuvel Chelliah
- NOAA/EMC: Jesse Meng
- Monthly telecons organized by **Mimi Hughes (PSL)**

- Key results

- Evaluated the NWM v1.2 and 2.0 retrospective simulations using *in-situ observations*
  - **Soil moisture:**
    - Positively biased at most CONUS locations
    - Variability and  $\leq 10$ th percentile events: comparable to the NLDAS-2 model suite
  - **Streamflow:**
    - Wet biased across much of the CONUS
    - Low-flow streamflow ( $\leq 10$ th percentile): acceptable performance in Pacific Northwest and southeast US

# An NWM Project: Application of the NWM for Drought Monitoring

## *Outstanding issues in the NWM v2.0*

- 1) Its retrospective period (1993-2018) is relatively short
  - will be remedied in v2.1, which starts from 1979 for the retrospective simulation
- 2) It uses different precipitation forcings for the retrospective and real-time periods
  - Retrospective: NLDAS-2
  - Real-time: HRRR/RAP/MRMS/MPE

*Hughes et al. 2020 (in prep)*

# An NWM Project: Application of the NWM for Drought Monitoring

## *CPC Contribution (01/2020-08/2020)*

1. Evaluated the NWM v2.0 retrospective simulation using the USDM
2. Studied an outstanding issue of the NWM v2.0 for drought monitoring
  - Precipitation mismatch between the retrospective and real-time analysis

# An NWM Project: Application of the NWM for Drought Monitoring

## *CPC Contribution (01/2020-08/2020)*

1. Evaluated the NWM v2.0 retrospective simulation using the USDM
  - Processed the NWM v2.0 data (1993-2018) by interpolating the native model data (3-hourly, 1km) to daily means at NLDAS-2's lat-lon grid

# An NWM Project: Application of the NWM for Drought Monitoring

## *CPC Contribution (01/2020-08/2020)*

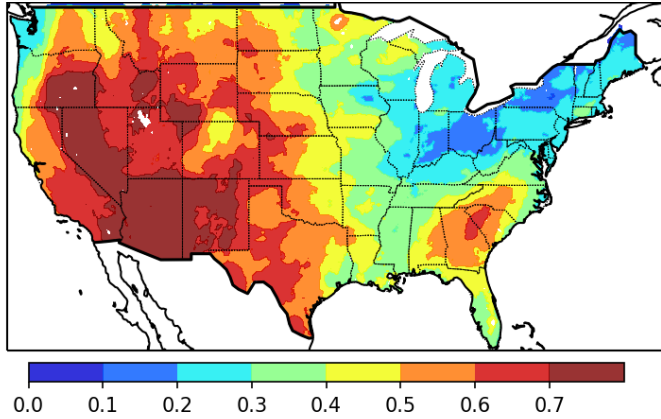

### 1. Evaluated the NWM v2.0 retrospective simulation using the USDM

- Processed the NWM v2.0 data (1993-2018) by interpolating the native model data (3-hourly, 1km) to daily means at NLDAS-2's lat-lon grid
- Evaluated the NWM **soil moisture** using contingency table based metrics
  - NWM soil moisture percentiles are converted to D0-D4 in order to compare with the USDM
  - Focus on their common period: 2000-2018

# 1.1 An Evaluation of the NWM using the USDM: *Evaluation*

Frequency of drought occurrence (D0-D4)

USDM

False Alarm Ratio

0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9

**<50% detection rate in the western US and southeastern US**

We need to use caution when using the USDM to evaluate land surface models (LSMs), because it is not a fair apple-to-apple comparison:

1. They use different base periods to quantify drought anomalies.
  - The USDM uses century-long data and captures both short-term and long-term droughts, whereas LSMs are subject to the length of their available simulations
2. The USDM integrates a multitude of drought indices, whereas LSMs usually use a single variable (e.g. soil moisture) to indicate drought conditions.

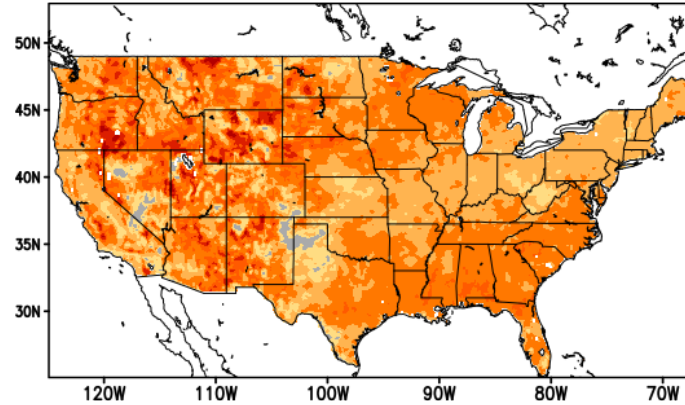

# 1.2 An Evaluation of the NWM using the USDM: *Caveats*

Frequency of drought occurrence (D0-D4): 2000-2011

USDM

NWM

VIC\_LIVNEH (base: 1915-2011)

VIC\_LIVNEH (base: 1993-2011)

The VIC\_LIVNEH simulation (1915-2011, Livneh *et al.* 2013) is used to help interpret the NWM vs. USDM differences, while keeping in mind that it uses a different LSM from the NWM:

1. When a century-long base period is used, the VIC\_LIVNEH captures long-term droughts in the W US and SE US.
2. With a century-long base period, the VIC\_LIVNEH still considerably differs from the USDM, in part due to the differences in the drought indicators they use.

# 1.2 An Evaluation of the NWM using the USDM: *Caveats*

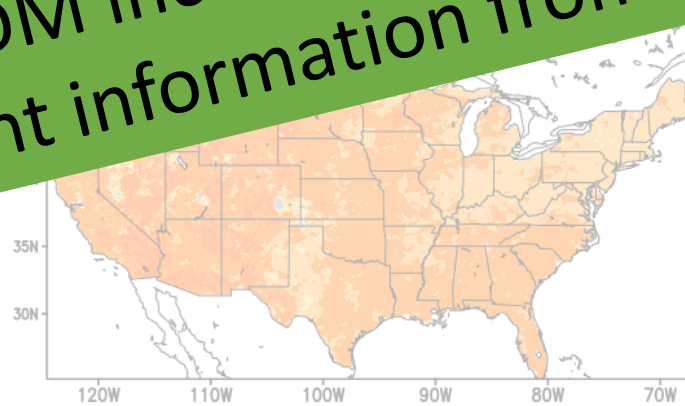

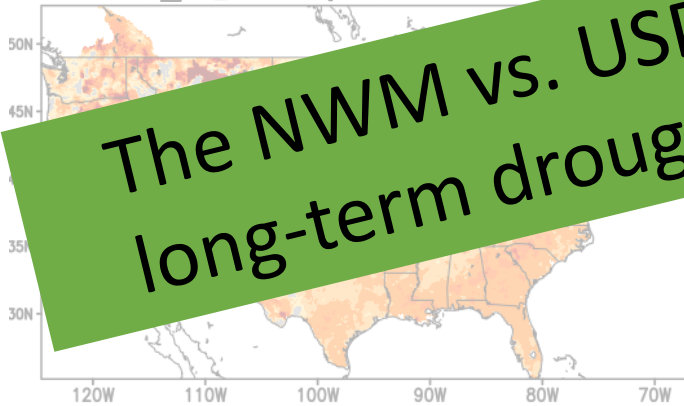

Frequency of drought occurrence (D0-D4): 2000-2011

USDM

NWM

VIC\_LIVNEH (base: 1915-2011)

The VIC\_LIVNEH simulation (1915-2011, Livneh *et al.* 2013) is used to compare the NWM vs. USDM. The VIC\_LIVNEH simulation keeps the same base period as the USDM.

1. With a century-long base period, the VIC\_LIVNEH captures long-term droughts in the W US and SE US.

2. With a century-long base period, the VIC\_LIVNEH still considerably differs from the USDM, in part due to the differences in the drought indicators they use.

The NWM vs. USDM inconsistency can be remedied by merging long-term drought information from the USDM with the NWM.

# 1.3 An Evaluation of the NWM using the USDM

# 1.3 An Evaluation of the NWM using the USDM

## *An approach to remedy the USDM vs. NWM inconsistency*

Frequency of drought occurrence (D0-D4)

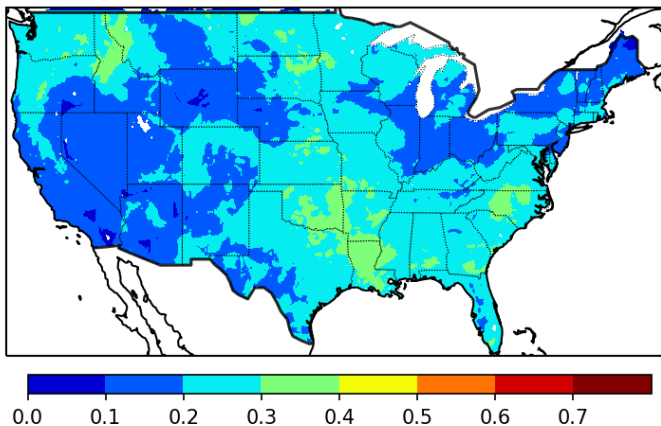

USDM

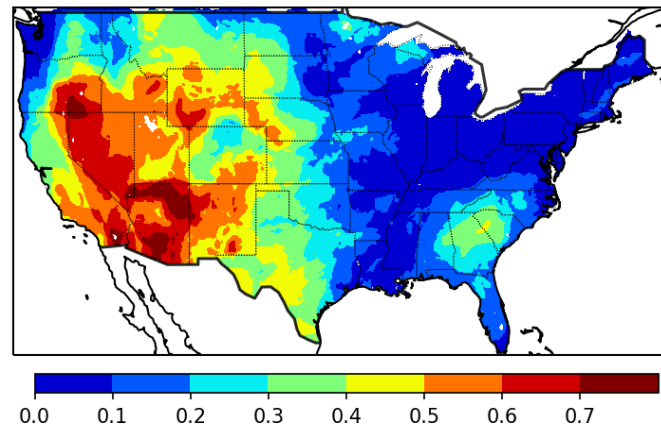

NWM

USDM (short-term)

USDM (long-term)

A key reason for the USDM vs. NWM inconsistency:

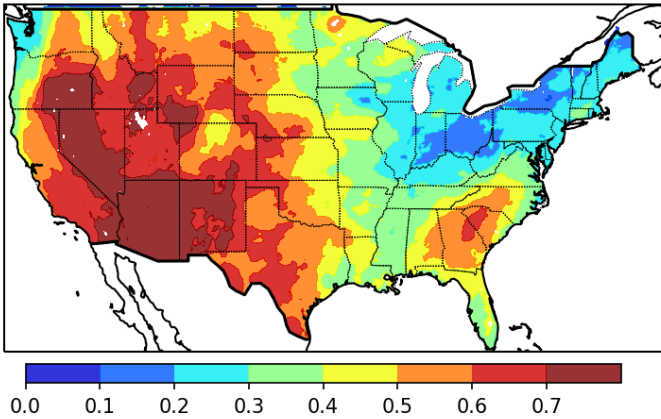

- long-term droughts are insufficiently captured in the NWM because of its relatively short duration

# 1.3 An Evaluation of the NWM using the USDM

*An approach to remedy the USDM vs. NWM inconsistency*

Frequency of drought occurrence (D0-D4)

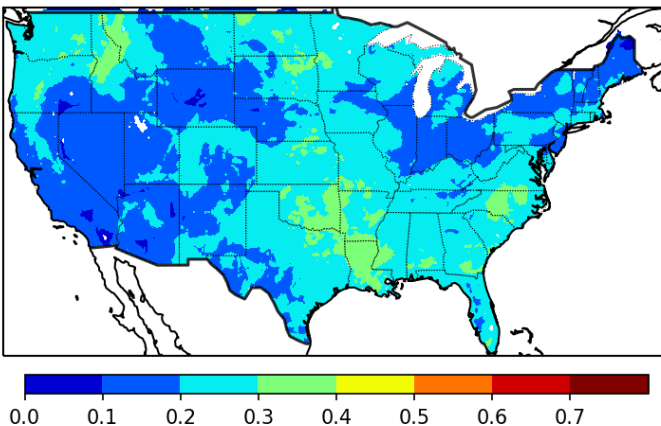

USDM

NWM

USDM (short-term)

USDM (long-term)

Integrate the NWM with the USDM long-term drought component using their joint probability (Hao and AghaKouchak 2014) to produce *a preliminary merged NWM product*

**<50% detection rate in the western US and southeastern US**

*How well does the merged product do?*

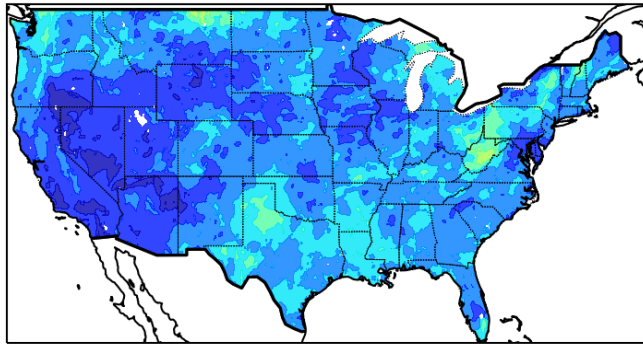

# 1.3 An Evaluation of the NWM using the USDM

*An approach to remedy the USDM vs. NWM inconsistency*

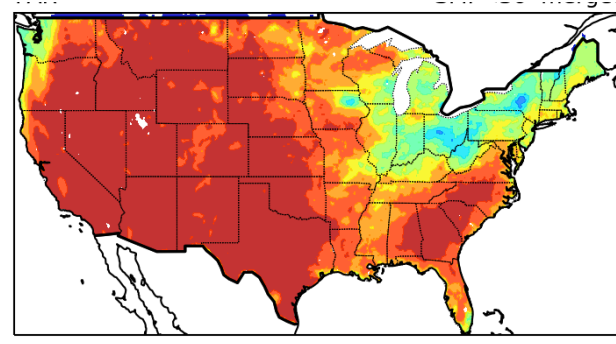

Probability of Detection

*NWM\_merged vs. USDM*

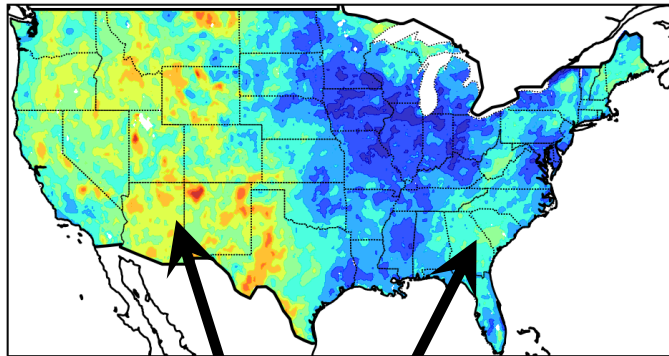

0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1.0

False Alarm Ratio

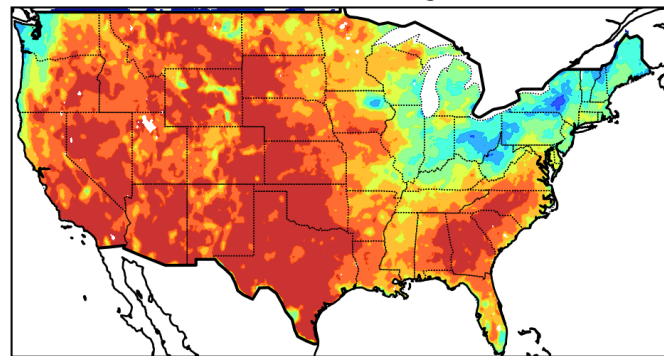

0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9 1.0

*NWM vs. USDM*

0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9

0.0 0.1 0.2 0.3 0.4 0.5 0.6 0.7 0.8 0.9

**<50% detection rate in the western US and southeastern US**

*How well does the merged product do?*

Merging the USDM long-term drought component with the NWM:

- substantially improves drought detection rate
- reduces false alarm ratio.

# An NWM Project: Application of the NWM for Drought Monitoring

## *Outstanding issues in the NWM v2.0*

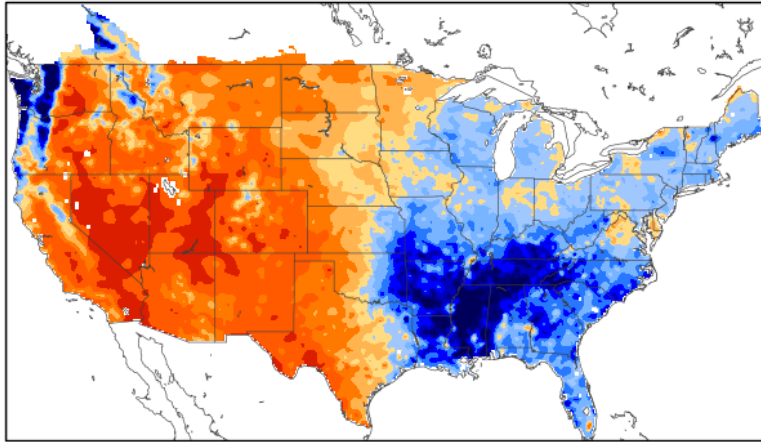

- 1) Its retrospective period (1993-2018) is relatively short
  - will be remedied in v2.1, which starts from 1979 for the retrospective simulation
- 2) It uses different precipitation forcings for the retrospective and real-time periods
  - Retrospective: NLDAS-2
  - Real-time: HRRR/RAP/MRMS/MPE

*Hughes et al. 2020 (in prep)*

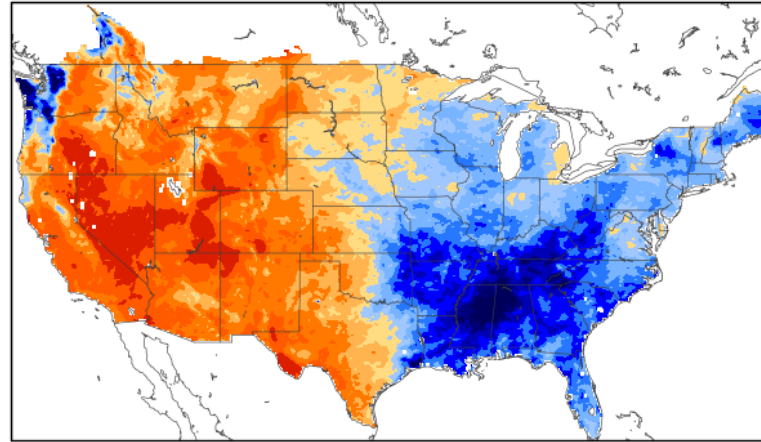

# 2. An Outstanding Issue of the NWM v2.0

## *Retrospective vs. real-time P forcing inconsistency*

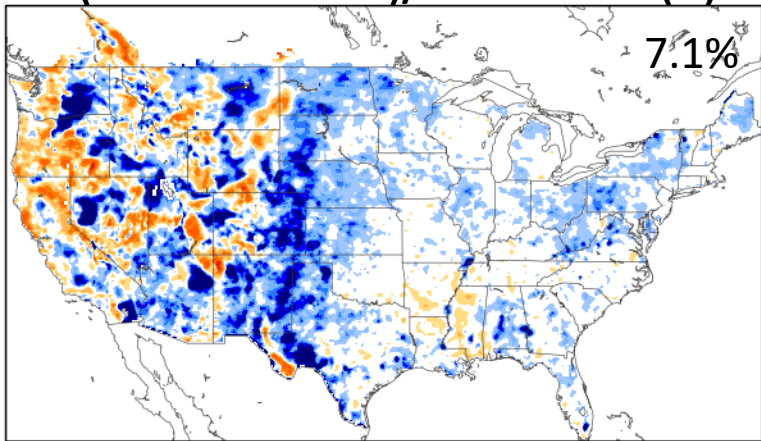

NLDAS-2

NWM

$(\text{NWM} - \text{NLDAS-2}) / \text{NLDAS-2} * 100(\%)$

NWM - NLDAS-2

NWM analysis vs. NLDAS-2 precipitation comparison (06/20/2019-06/19/2020):

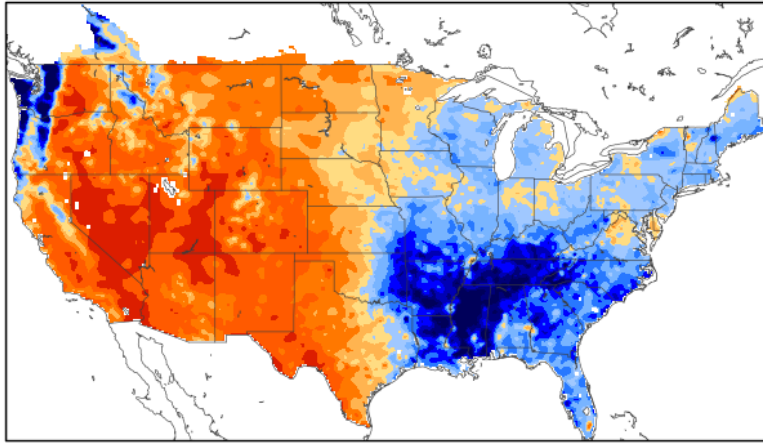

- NWM is noticeably wetter than NLDAS-2 across much of the CONUS (7.1%).

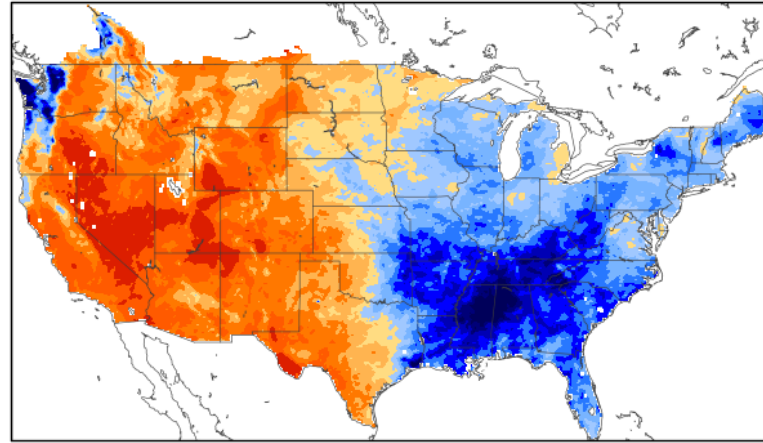

# 2. An Outstanding Issue of the NWM v2.0

# Summary

## 1. An evaluation of the NWM v2.0 using the USDM

- The NWM tends to underestimate the USDM drought occurrence, particularly in the western US and southeastern US.

# Summary

## 1. An evaluation of the NWM v2.0 using the USDM

- The NWM tends to underestimate the USDM drought occurrence, particularly in the western US and southeastern US.
- Such NWM underestimation is due to a typical caveat of using the USDM to evaluate land surface models (LSMs), and thus cannot be attributed to the NWM deficiencies alone.
  - The USDM uses a century-long base period to estimate drought anomalies and thus captures both short-term and long-term droughts, whereas LSMs are subject to the length of their simulations.
  - The USDM integrates multiple drought indicators whereas LSMs often use a single variable to indicate drought conditions.

# Summary

- Such NWM underestimation is due to a typical caveat of using the USDM to evaluate land surface models (LSMs), and thus cannot be attributed to the NWM deficiencies alone.
  - The USDM uses a century-long base period to estimate drought anomalies and thus captures both short-term and long-term droughts, whereas LSMs are subject to the length of their simulations.
  - The USDM integrates multiple drought indicators whereas LSMs often use a single variable to indicate drought conditions.
- The USDM vs. NWM inconsistency can be remedied by merging the NWM with the USDM long-term drought component.

# Summary

## 2. An outstanding issue of the NWM v2.0

- The NWM v2.0 uses different precipitation (P) forcings for its retrospective simulation and real-time analysis, which impacts its quantification of real-time drought anomalies.
  - The P differences vary with region, season and weather event, with the NWM analysis being ~7.1% wetter than NLDAS-2 for the annual mean in the CONUS.

# Summary

## 2. An outstanding issue of the NWM v2.0

- The NWM v2.0 uses different precipitation (P) forcings for its retrospective simulation and real-time analysis, which impacts its quantification of real-time drought anomalies.
  - The P differences vary with region, season and weather event, with the NWM analysis being ~7.1% wetter than NLDAS-2 for the annual mean in the CONUS.

### *Looking Forward*

Future NWM versions are expected to have continued improvements in drought monitoring capability

- Longer retrospective simulation (e.g. v2.1 starts from 1979)
- Upgrades in forcings and model physics
- Domain expansion
