

Weeks 2-3 Global Tropics Hazards Outlook

8/13/2024

Nick Novella

NWS / NCEP / Climate Prediction Center

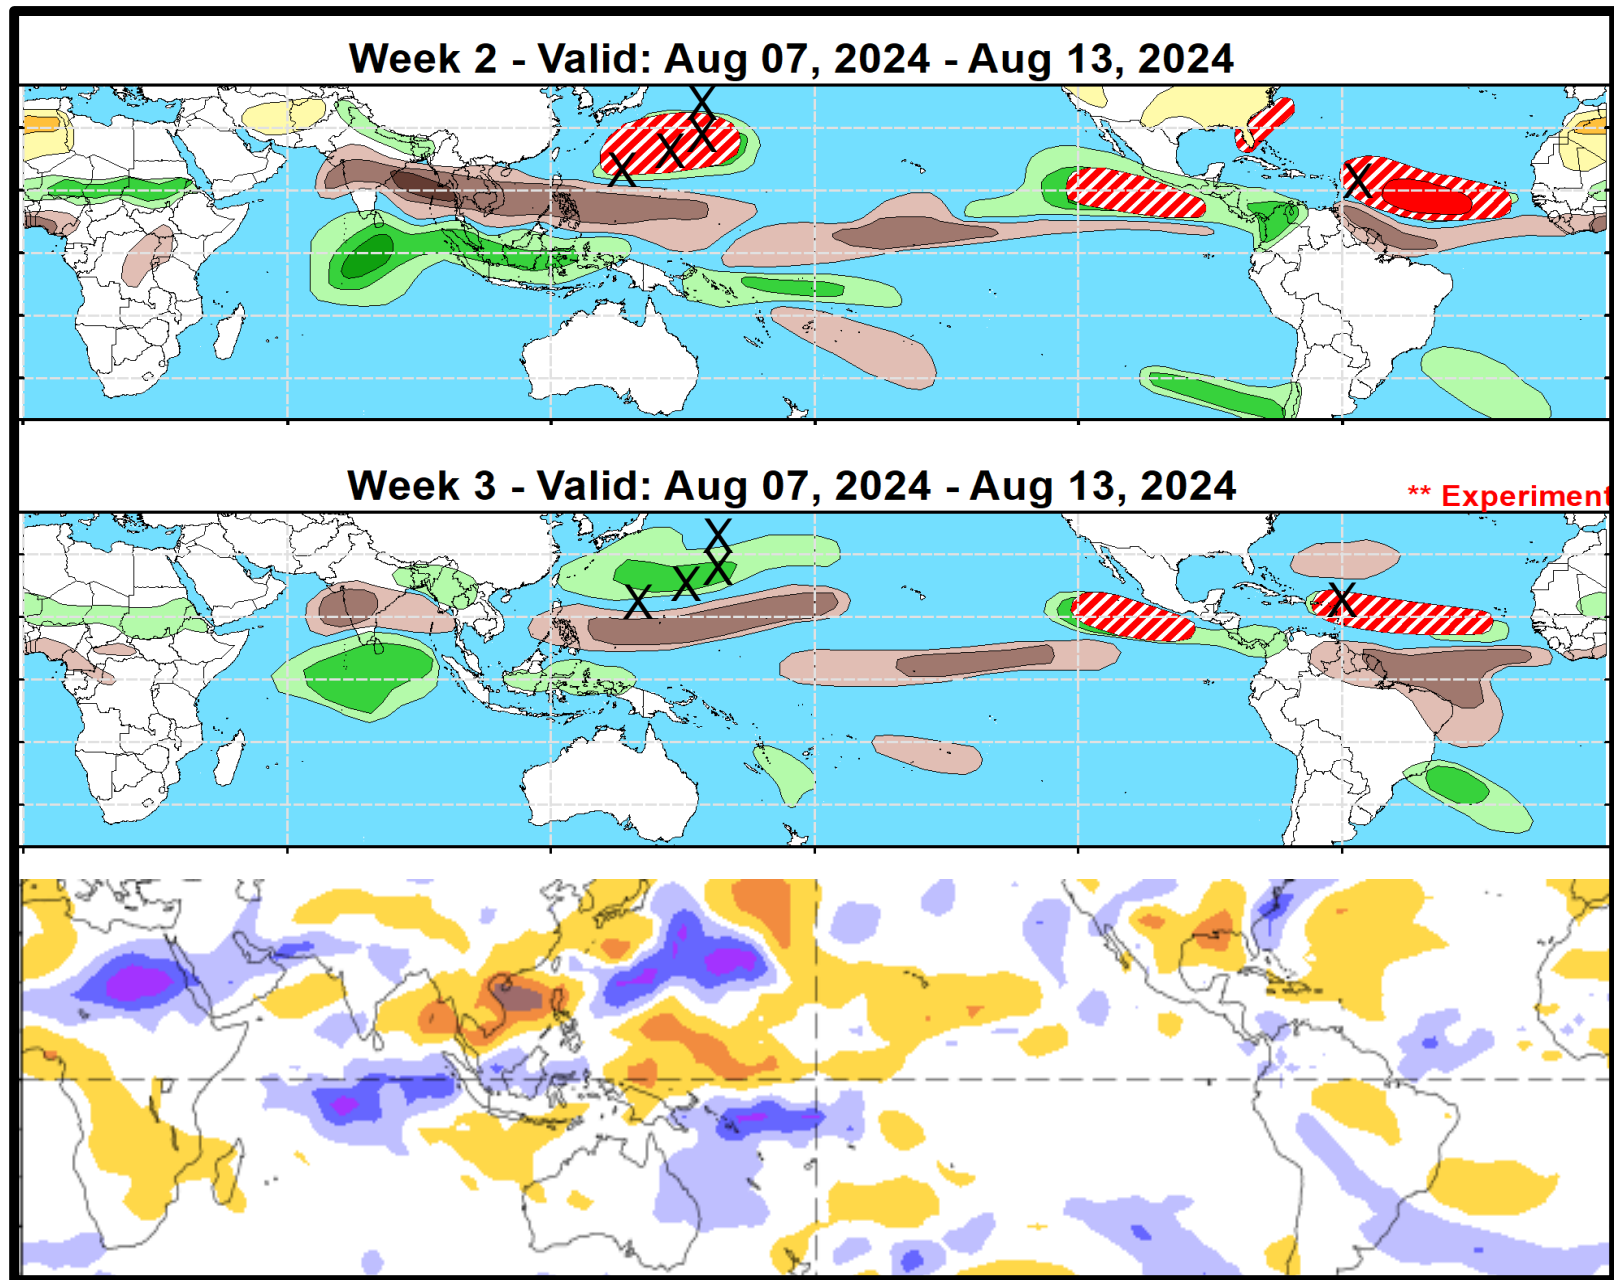

Outlook Review: TC development & anomalous precipitation during the past week

WPAC

- Maria (8/7)
- Son-Tinh (8/12)
- Ampil (8/12)
- Wukong (8/13)

ATL

- Ernesto (8/12)

Synopsis of Climate Modes:

ENSO: (Aug 8, 2024 Update) *next update on Thursday, Sep 12th*

- ENSO Alert System Status: [La Niña Watch](#)
- ENSO-neutral is expected to continue for the next several months, with La Niña favored to emerge during SON (66% chance) and persist into the Northern Hemisphere winter 2024-25 (74% chance during November-January).

MJO and other subseasonal tropical variability:

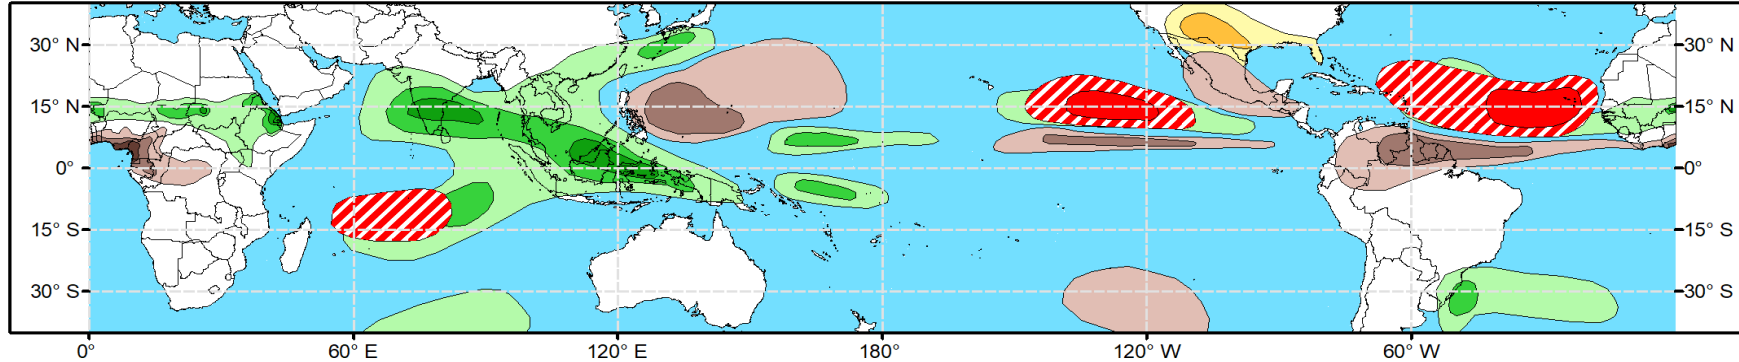

- As previously forecast, RMM observations show renewed MJO activity over the Western Hemisphere during the past week.
- Dynamical models have been consistently advertising a robust Indian Ocean MJO event that propagates eastward into the Maritime Continent during the next several weeks.
- Given these conditions, the large-scale environment is expected to be favorable for additional tropical cyclogenesis across the Atlantic basin, in-line with an increasingly active climatology for late August and early September.
- Conversely, there are decreased chance for tropical cyclone formation in the western Pacific, following a fairly active period since late July.

200-hPa Velocity Potential Anomaly Maps:

- The VP fields have become more coherent during the past week, but still feature modes of higher frequency variability.
- By week-1, there is very good agreement in the models favoring a more canonical wave-1 MJO pattern, with continued Kelvin and Rossby wave activity to further enhance the convective environment over Africa.
- This may then promote more vigorous, and moisture rich easterly waves exiting into the Main Development Region.

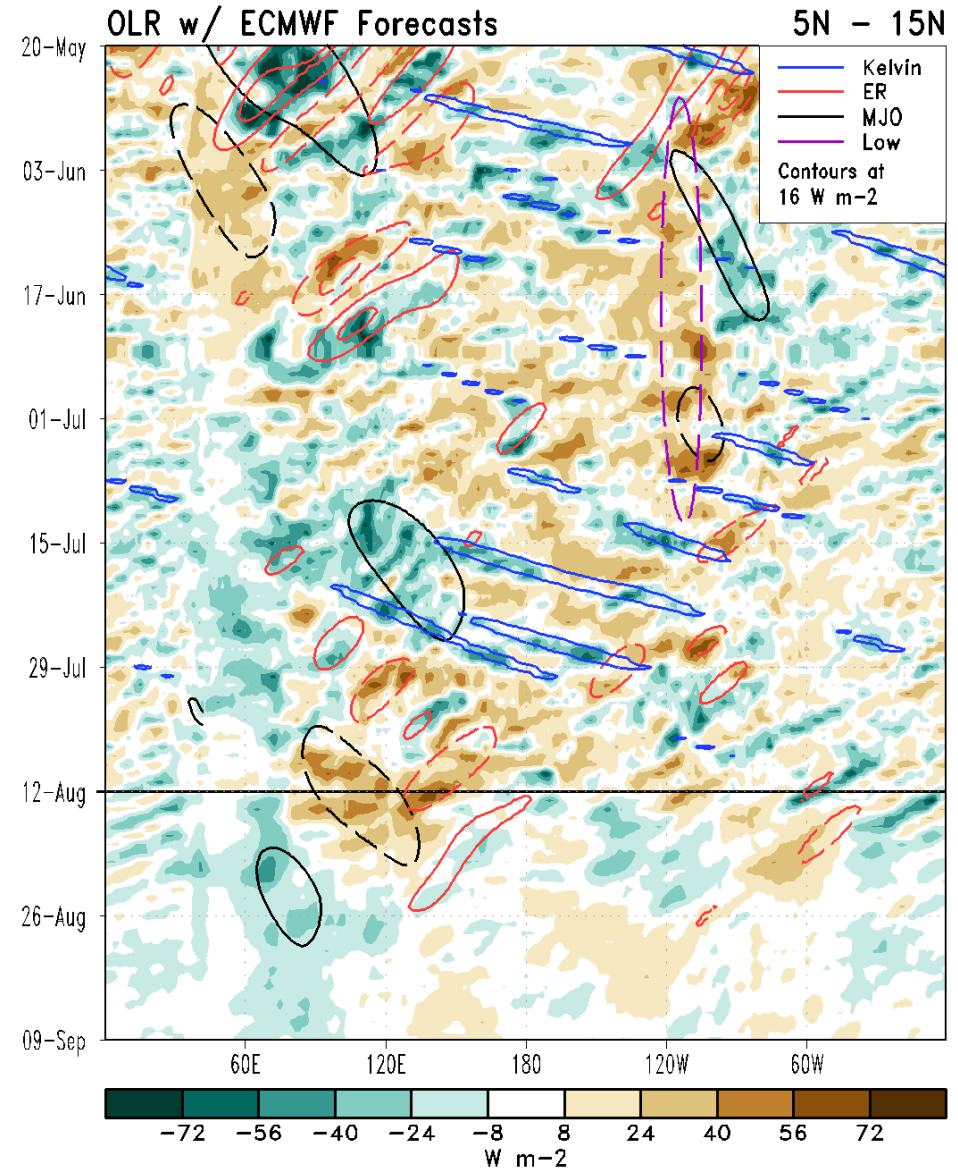

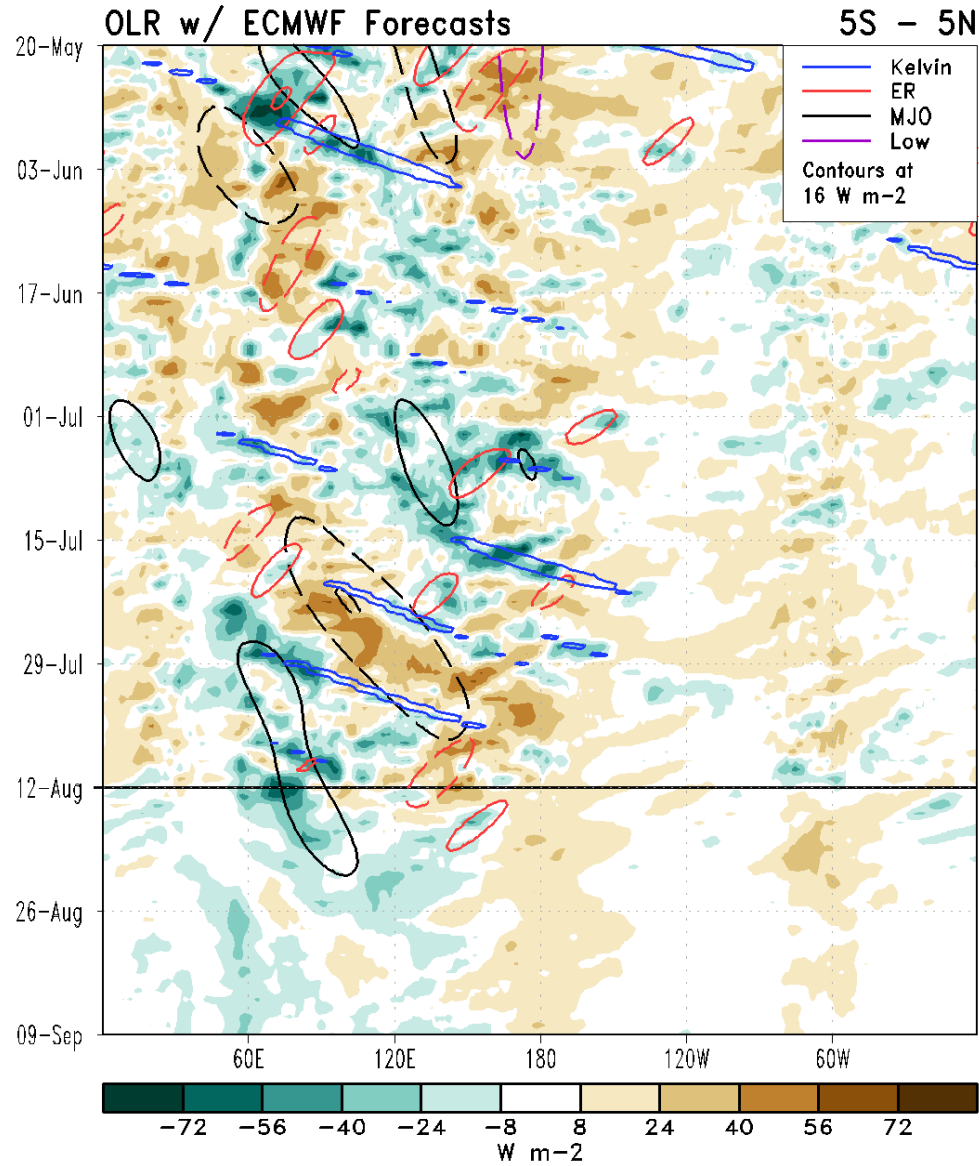

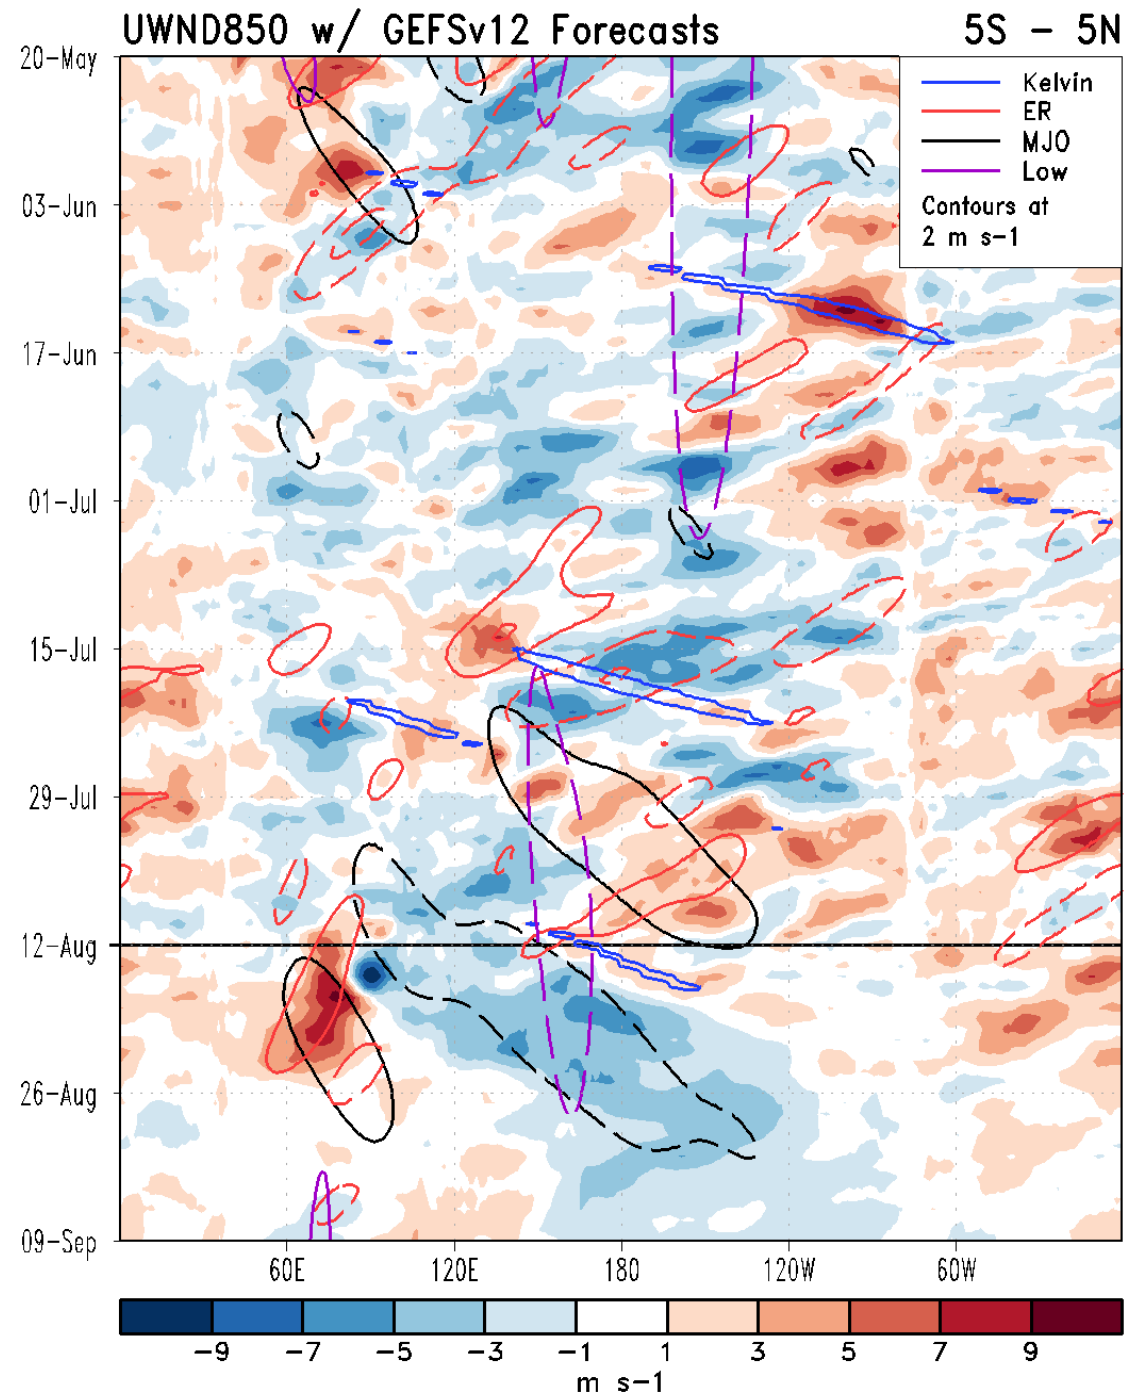

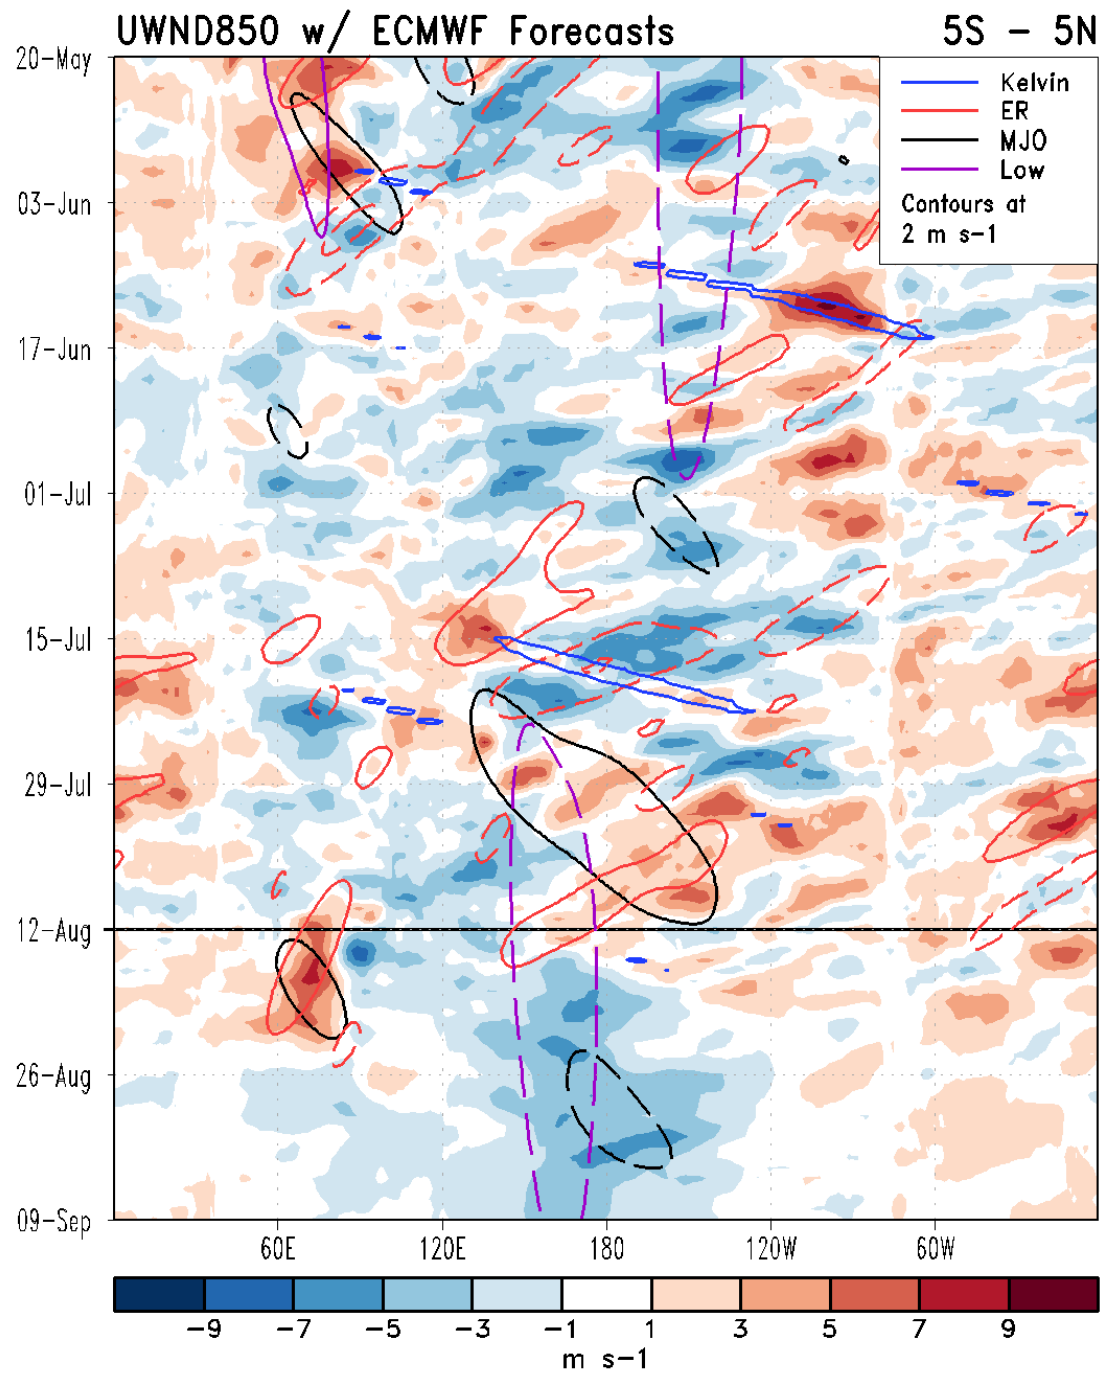

RMM Index Observations & Forecasts:

- Consistent with the velocity potential forecasts, good agreement exists in the RMM forecasts depicting an amplifying MJO signal over the Indian Ocean with continued eastward propagation into the Maritime Continent by late August
- Although the signal weakens as it approaches the Maritime Continent, there are several ensemble members favoring a higher amplitude event heading into September.
